There are roughly one billion surveillance cameras in use around the world. With this in mind we can deduce that there is a lot of video information flying about the web from state and private actors. Some of it has been captured in several tools that are open source and that's what we're going to be looking into in this article. Before we jump into these tools I would ask you to consider being responsible with the information provided.

The below list has been compiled from cipher387's Mini GEOINT Cheat Sheet, this article is more of a review of what they have provided, but all kudos goes to cipher for compiling the list, please check out other resources by them [here](#).

1- Surveillance Under Surveillance

Link: sunders.uber.space

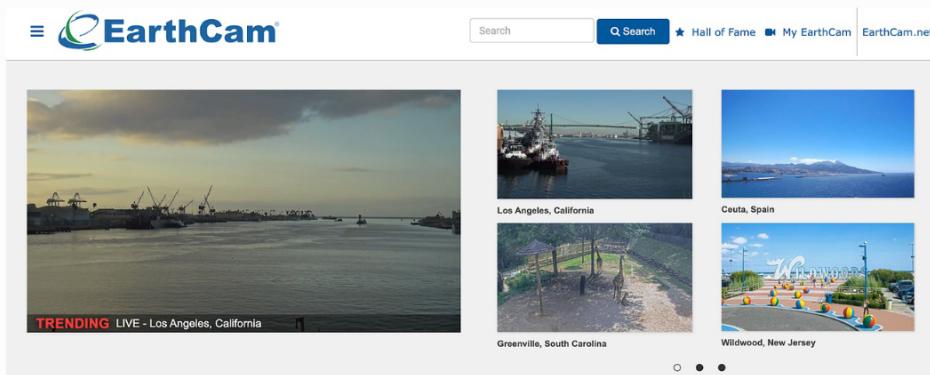

This is a community street camera mapping tool, provided by users like you and me who know of cameras and guards that are watching you. There are no live

feeds here, but it can give you an understanding of the types of surveillance in a certain areas.

Surveillance is broken down into icons of different categories from surveillance in private indoor spaces to public places. I've found this tool fascinating and is definitely one for a bookmark.

2- EarthCam

Link: earthcam.com

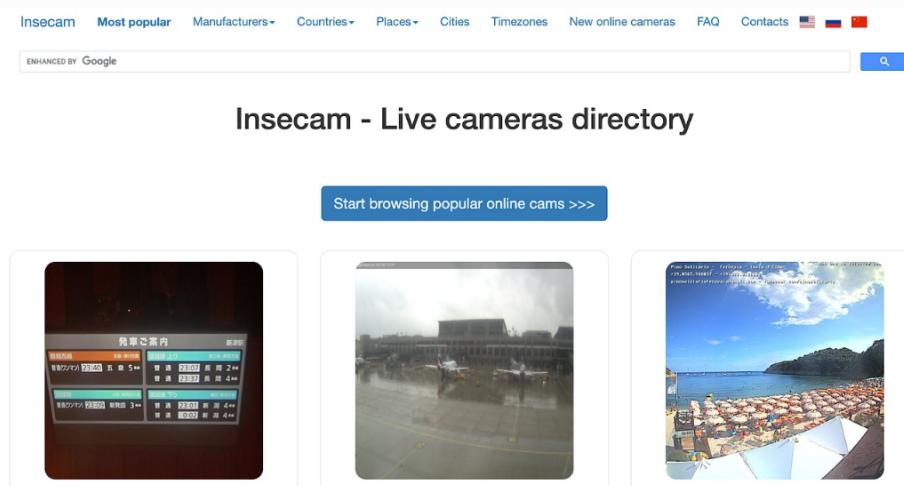

EarthCam is a network of connected live feed cameras. Founded in 1996 it is a leader in providing webcam content, technology and services. Individuals who have either a usb, solstice or axis cameras can join the community, start streaming

and even earn money. This has lead to a wide range of possible cameras you can access just by visiting the website. Think of this website a YouTube or Twitch but for live cameras of random areas. Depending on the feed you select it can be clunky video and take up a lot of memory, but this doesn't detract from its usefulness.

3- Insecam

Link: HTTP address, so I'm not willingly going to provide it

Insecam is a live camera directory where you can search cameras across the globe. The site is on an unencrypted network which raises a red flag from the outset,

and its operation has raised legal and ethical concerns, and where its activities may be illegal depending on the country. I haven't really used this site but it was included in cipher387's gitHUB Mini GEOINT cheatsheet so I thought i'd include it here. I'd personally stay away from this site.
